                                                                                                                                                                                                                                                                                                                                                                                                                  ó
AANSO205 is the gene sequence of the natural LTA gene. The LTA gene of the site directed mutant SDM1 (see AANSO206) is inactive. The inventors claim a vaccine prepn. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heat-labile toxin; LT-A; LT-B; mutant; transgenic plant; vaccine; oral;

This synthetic Escherichia coli heat-labile toxin (LT) A subunit (LT-A) is encoded by a plant-codon optimized cDNA. The cDNA sequence contains plant-preferred codons and elliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding value) was made to accomodate the creation of a NCoI restriction site around the initiator methionine codon. Novel polymucleciides encode a mutant LT-A polypeptide or a mutant vibrio cholerae cholera toxin (CT) As subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.

                                                                                                                                                                                                                                                       the wild type arginine was replaced with glycine at residue 10. The wild type arginine was replaced with glycine at residue 10. Of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and alminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding value) was made to accompante the creation of a Ncol restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant UT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide. Which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce acidle vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. Coli or V. cholerae. The mutant polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NB: This sequence does not appear in the specification, it was made from the wild type sequence shown in AAY96647, which appears in Figure 1.

The LTA gene can directed mutant SDM1 (see AANSO206) is inactive. The inventors claim a vaccine prepr. active against pig scours which contains an inactivated LTA component, together with additional K88 annigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.

enterotoxin (LT) mutant LTS63Y. LTS63Y and LTdell10/112 (AA000507)
are two novel detoxified and immunologically active proteins (LT
mutants) derived by site-directed mutagenesis of the Al subunit of wild
type LT. The substitution of Sar to Tyr at position 63 in LTS63Y blocks
NAD-binding, Delletion of Glu residues at positions 110 and 112 in
LTdell10/112 eliminate the enzymatic activity of LT. The Al subunit of
wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that
regulates CAMP levels. The resulting increase in CAMP is the cause of
diarrhoea in humans and animals e.g. pigs The mucosal immunogenicities
of mutant heat-labile endotoxins LTS63Y and LTdell10/112 were tested.
Groups of mice were immunised with LTS623Y or LTdell10/112. The control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New detoxified mutants of Escherichia coli heat-labile enterotoxin
useful as vaccine for preventing and treating diarrhoea, and as adjuvant
for antibody production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    groups received phosphate buffered saline (PBS) alone. The serum and faecal antibody titres to LT were determined. The results showed that mice immunised with LTSG3Y or LTGell10/1/12 contained high and comparable level of anti-LT antibodies in sera and faecal extracts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              compared with those immunised with wild-type LT. The LT mutants are useful as a vaccine for preventing and treating diarrhoea and as an

Claim 6; Page 42-44; 48pp; English.

The present sequence represents Escherichia coli heat-labile enterotoxin (LT) mutant LTdell10/112. LTS63Y (ANU00506) and LTdell110/112 are two novel detoxified and immunologically active proteins (LT mutants) derived by site-directed mutagenesis of the Al subunit of wild type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks NAD-binding. Deletion of Glu residues at positions 110 and 112 in LTdell110/112 eliminate the ensymatic activity of LT. The Al subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that regulates cAMP levels. The resulting increase in CAMP is the cause of diarrhoea in humans and animals e.g. pigs. The mucosal immunogenicities of mutant heat-labile endotoxins LTS63Y and LTdell10/112 were tested. Groups of mice were immuniscal with LTS629 or LTdel110/112. The control groups received phosphate buffered saline (PBS) alone. The serum and faecal antibody titres to LT were determined. The results showed that mice immunisced with LTS639 or LTdel110/112 contained high and comparable level of anti-LT antibodies in sera and faecal extracts

This is mutant S63K Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The wild-type serine was replaced with lysine at residue 63 of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding value) was made to accomodate the creation of a NcoI restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (GT) A subunit (GT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic coll sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially creatment against E. coli or V. choleres The mutant polypeptides are used to be a subunit coll to the prophylactic or therapeutic creatment against E. coll or V. choleres The mutant polypeptides are used to be appeared to be a subunit coll or v. choleres the mutant polypeptides are used to be a subunit coll or v. choleres the mutant polypeptides are used to be appeared to the prophylactic or therapeutic creatment against E. coll or V. choleres The mutant polypeptides are used. The mutant polypeptides are used to the propertion of plants to the propertion of plants of the propertion of plants of the propertion of the propertion of plants of the properties of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NB: This sequence does not appear in the specification, it was made from the wild type sequence shown in AAY96647, which appears in Figure 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heat-labile toxin, LT-A; LT-B; mutant; transgenic plant; vaccine; oral; adjuvant; anti-bacterial; A63K+R192G; double mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /label= R192G

                                                                                                                                                                                                                                                       This is Escherichia coll heat-labile toxin (LT) A subunit (LT-A) double mutant $63K+R192G. The wild-type serine was replaced with lysine at residue 53 and wild-type arguine was replaced with spine at residue 20 of the mature protein. The coding sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accompact the creation of a NcoI restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant IT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) collapspide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding IT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the production of plant cells for the production against E. coli or V. cholerae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Heat-labile toxin; LT-A; LT-B; mutant; transgenic plant; vaccine; oral;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Spurious mRNA processing. A single codon insertion (GTG encoding value) was made to accomodate the creation of a Ncol restriction site around the initiator methionine codon. Novel polynuclectides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (GT) A subunit (GT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynuclectide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or CT-B compared to the polynuclectides are useful for the transformation of plant cells for the production of transgenic plants to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (LT-A). The wild-type alanine was replaced with arginine at residue 72 of the mature protein, which was caused by a nucleotinde change of GC to AG at position 273-274 in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants. Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A shown in AAY96646 which is given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is mutant A72R Escherichia coli heat-labile toxin (LT) A subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositions to elicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 73 GQSILSGYSTYYIYVIATAPNMFNVNDVLGVYSPHPYEQEVSALGGIPYSQIYGWYRVNF 132

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is Escherichia coli heat-labile toxin (LT) A subunit (LT-A) double mutant A72R+R192G. The wild-type alanine was replaced with arginine at residue 72 and wild-type againine was replaced with all plycine at residue 192 of the mature protein. The coding sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valline) was made to processing. A single codon insertion (GTG encoding valline) was made to methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide compared to the initiator methionine codon. Novel polynucleotides encode a mutant (CT-A) polypeptide, which have reduced enzyme activity as compared to the vild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comparises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful R subunit (CT-B) or the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the vaccines. The mutant polypeptides are also useful as adjuvants.

The mutant polypeptides are also useful as adjuvants.

Note: This sequence does not appear in the specification. It was
                                                                                                                                                                                                                                Heat-labile toxin; LT-A; LT-B; mutant; transgenic plant; vaccine; oral; adjuvant; anti-bacterial; A72R+R192G; double mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       211

This sequence represents a fragment of an Escherichia coll heat labile toxin subunit A (LT-A). This protein is used in a method resulting in a mutant LT-A protein which has the wild type Ala residue at position 72 changed to an Arg residue resulting in a toxin which retains its immunogenicity but is detoxified. Detoxification is defined in the specification as a reduction in toxicity relative to wild-type toxin, such that any residual toxicity is sufficiently low to allow use as an effective immunogenic composition in humans without significant side effective immunogenic composition in humans without significant side immunogenic compositions, optionally comprising an adjuvant and/or a second immunogenic antigen. Such compositions can be administered to prevent disease in a subject e.g. traveller's diarrhose in humans. The protein or compositions are aspecially administered as vaccines useful to prevent or treat infections by enterotoxigenic strain of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Heat labile toxin subunit A; LT-A; mutant; immunogen; detoxification; carrier; adjuvant; prevention; treatment; disease; diarrhoea; vaccine; infection; enterotoxic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a fragment of a mutant Escherichia coli heat labile toxin subunit A (LT-A) where the wild type Ala residue at position 72 is replaced by an Arg residue resulting in a toxin which cretains its immunogenicity but is detoxified. Detoxification is defined in the specification as a reduction in toxicity relative to wild-type toxin, such that any residual toxicity is sufficiently low to allow use as an effective immunogenic composition in humans without significant side effects. The protein can be combined with an acceptable carrier in immunogenic compositions, optionally comprising an adjuvant and/or a second immunogenic antigen. Such compositions can be administered to prevent/treat disease in a subject e.g. traveller's diarrhoea in humans. The protein or compositions are especially administered as vaccines cuseful to prevent or treat infections by enterotoxigenic strain of E. coli in mammals (especially humans).
                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       Heat labile, toxin subunit A; LT-A; mutant; immunogen; detoxification; carrier; adjuvant; prevention; treatment; disease; diarrhoea; vaccine; infection; enterotoxic.

J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AA38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
NOTE: This sequence does not appear in the specification but has been constructed from the wild-type sequence represented in AAW65074.
                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                   142 NREYRDRYYRNLNIAPAEDGYRLAGFPPDHQAWREEFWIHHAPQGCGNSSRTITGDTCNE 201

J.Biol. chem., 259, 5037-504 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates to immunogenic, detoxified IT-A proteins and their use in vaccines to protect against enterctoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the sequence of sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The wild-type sequence coding for the A subunit of the heat labile toxin (II-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates timmunogenic, detoxified II-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutain is not printed in the sequence of specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid, numbering is based on the cholera toxin A subunit sequence).

A; Title: DNA Sequence of both chromosomes of the cholera pathogen Vibrio cholerae.
A; Reference number: A82035; MUID: 20406833
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Map position: 1
C;Complex: the cholera enterotoxin molecule contains three kinds of chains; an alpha
ciate noncovalently with the subunit B, an aggregate of five beta chains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A; Description: the acitive component of the toxin that is primarily responsible for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
